PROFESSIONAL SUMMARY

Backend engineer with 4 years of experience building data-heavy production systems. I've built event-driven microservices, worked with cloud infrastructure on GCP, REST APIs, and database design on the Web2 side, and owned 50+ exchange and blockchain integrations across EVM chains, Solana, Cardano, and more on the Web3 side. Experienced in building reliable backend systems, integrating external platforms, and solving complex data consistency challenges in production environments.

SKILLS SUMMARY

- **Languages:** TypeScript, Solidity, JavaScript, Python
- **Backend:** Node.js/Express, REST/GraphQL, WebSockets, Pub/Sub, System Design
- **Blockchain:** DApps, DeFi, Smart Contracts, EVMs, Solana, Hyperliquid, Aptos, Sui, Cardano
- **Databases:** PostgreSQL, MongoDB, Redis, Firestore, Supabase, IPFS
- **DevOps:** Docker, CI/CD (GitHub Actions), GCP

WORK EXPERIENCE

Kryptos - Software Development Engineer-I:

Sweden (Remote)

September 2023 - Present

- Single-handedly owned the full CEX and DEX integration layer on the platform and directly contributed to business growth by ensuring users got accurate transaction data, no missing balances, and correct cost basis reporting. This is the core of what retains users on a crypto tax platform.
- Built and maintained 50+ exchange connectors covering Binance, Coinbase, Kraken, KuCoin, Bybit, Bitget, Hyperliquid, and more. Each one handles balance fetching and full transaction history. Extended blockchain support to EVM chains, Solana, Cardano, ICP, Sui, and Aptos.
- Built the entire CSV and XLSX import pipeline from scratch. Covers file upload, exchange format auto-detection, parsing every transaction type, normalizing into a standard format, and pushing to Pub/Sub where pricing gets applied and tax reports get generated per country.
- Identified and resolved missing balance and transaction issues across the platform. For exchanges, researched the API documentation, found data gaps, and fixed the ingestion logic. For blockchains, used public chain explorers with the user's wallet address to locate missing data and reconcile it against what was stored.
- Worked on CI/CD pipelines using GitHub Actions across multiple services. Services are containerized with Docker, pushed to GCP Artifact Registry, and deployed to Cloud Run and Compute Engine in europe-west3 with rolling updates for zero downtime.
- Drove the migration from a multi-repo Firebase and Firestore setup to a single Turborepo monorepo with PostgreSQL. Redesigned the schema to handle millions of transactions, improved query performance, and organized everything into shared packages with clear service boundaries.

D Frame Foundation - Software Engineering Intern:

Den Haag, The Netherlands (Remote)

September 2022 - September 2023

- Developed and maintained backend services for the Reward Engine platform, including ERC-20 smart contracts on Polygon, automated token distribution workflows, and data processing pipelines using Web3.py, Apache Kafka, and MongoDB.
- Implemented AES-based data encryption and production IPFS infrastructure for secure storage and management of user-generated data across decentralized systems.

PROJECT

HyperBlitz – Real-Time Hyperliquid Analytics:

[Demo Link](#)

- Built a real-time explorer for the Hyperliquid ecosystem to track wallets, positions, balances, and trading activity using public APIs and WebSockets.
- Developed a client-side data pipeline using REST APIs and WebSockets with rate limiting, event deduplication, and live market data processing for low-latency updates.

Tools/Technologies used: React, TypeScript, WebSockets, Axios, Tailwind CSS, Vite, Hyperliquid API.

EDUCATION

Bharati Vidyapeeth's College of Engineering

- Bachelor of Technology - Computer Science and Engineering CGPA: 8.2

Delhi, India

July 2019 - July 2023
